

Write 15 separate SQL DDL or update DML queries, named “Query36” through “Query50”. Each query will contain a SQL DDL or update DML statement that is your solution for the translation of a “plain English” DDL or DML request. Each query is worth one point. The 15 “plain English” queries are:

36. ~~Create a table, called Dealership2, which has the same column names and data types as the Dealership table. Do **not** include a primary key constraint. Do **not** include an input mask for the dzip column.~~
37. ~~Create a primary index, called PrimaryKey, on the dcode column in Dealership2. Use “CREATE INDEX...” syntax.~~
38. ~~Create a table, called Vehicle2, which has the same column names and data types as the Vehicle table. Do **not** include a primary key constraint. **Do** include a foreign key constraint to Dealership2 and name it ForeignKey_to_Dealership2.~~
39. ~~Add a primary key constraint, called PrimaryKey, on the vvin column in Vehicle2. Use “ALTER TABLE...” syntax.~~
40. ~~Create an index, called FK_to_Dealership2, on the foreign key column in Vehicle2. Use “CREATE INDEX...” syntax.~~
41. ~~Using “INSERT INTO...SELECT” syntax, insert all the rows from Dealership into Dealership2.~~
42. ~~Using “INSERT INTO... VALUES” syntax, insert into the Dealership2 table:
193, Asg 5 Test Dealership, 10 Main St, Albany, NY, 12203~~
43. ~~Using “INSERT INTO... VALUES” syntax, insert into the Vehicle2 table:
A1B2C3WXYZ0123456, 193, 2015, SUBA, sedan, blue, 2310, gas, 6~~
44. ~~Change vweight to 3,210 in the row you inserted in Query43, identifying this row by using its primary key value.~~
45. ~~For all Dealership2 rows with a dcity value of “Albany”, change dstate to “GA” and dzip to null.~~
46. ~~Erase the single row of data inserted in Query43. Use the primary key value to pick the right row.~~
47. ~~Remove the foreign key constraint in Vehicle2 which was created by Query38.~~
48. ~~Drop the Vehicle2 table.~~
49. ~~Erase all the data in Dealership2.~~
50. ~~Drop the Dealership2 table.~~
